CEO INTEL

The Complete Alert & Intelligence Guide

Know Before It Costs You. Act Before They Tell You.

A complete guide to the alerts, signals, and intelligence notifications available in CEO Intel — across revenue, operations, finance, market intelligence, and relationship tracking.

For: Indian CEOs running ■10–200 Cr businesses

INTRODUCTION

Why Alerts Change Everything

Most Indian CEOs are running their businesses in reactive mode — not because they are bad leaders, but because their data is fragmented across systems that never talk to each other. Revenue is in the CRM. Operations are in the ERP. Finances are in Tally. Customer health is in a spreadsheet. And by the time someone connects the dots, the moment to act has already passed.

CEO Intel's alert system flips this. Instead of you going to look for problems and opportunities, the intelligence comes to you — automatically, continuously, and before anyone else in your business has noticed.

> ***"The best leaders don't just respond faster. They know sooner."***

TWO TYPES OF ALERTS

■ THREAT ALERTS

Surface problems before they become crises. A customer quietly reducing orders. A stockout building. A supplier showing stress signals. A receivable aging past the point of no return.

■ OPPORTUNITY ALERTS

Surface growth before competitors do. A customer scaling who has never been offered your full range. A demand spike 11 days before it hits the market. A client ready to expand scope before they tell you.

HOW IT WORKS

How CEO Intel Alerts Are Configured and Delivered

Every alert in CEO Intel follows the same architecture: it monitors a specific pattern across one or more connected data sources, compares it against your configured thresholds, and delivers actionable intelligence through every channel you use.

01

DATA SOURCES CONNECTED

CEO Intel pulls data from your CRM, ERP, accounting system, email, ecommerce platform, Google Sheets, and WhatsApp. Synced continuously — every 2 hours to 4 times daily depending on source.

02

PATTERNS DETECTED

AI processes every data point against configurable thresholds — your specific customers, your specific products, your specific business rhythms. No generic benchmarks.

03

INTELLIGENCE DELIVERED

When a threshold is crossed, CEO Intel delivers the alert through your chosen channels — simultaneously, with context and recommended action.

DELIVERY CHANNELS

■ **CEO Intel Dashboard**	Live alert feed with full context, drill-down data, and recommended actions. Always on, always updated.
■ **Email Briefing**	Morning intelligence digest with all overnight alerts summarised and prioritised. Delivered before your first meeting.
■ **WhatsApp Notification**	Instant alert for high-priority threats. One tap to see full context. Designed for the CEO on the move.
■ **In-App Notification**	Real-time push notification when a critical threshold is crossed. Configurable by alert type and severity.

CONTENTS

What's Inside This Guide

Section 1 — Revenue & Customer Intelligence Alerts

→ Customer Order Decline Alert
→ Last-Contact Gap Alert (Relationship Drift)
→ Customer Churn Risk Score Alert
→ Revenue Concentration Risk Alert
→ Deal Pipeline Velocity Alert
→ Upsell & Expansion Opportunity Signal
→ New Customer Acquisition Signal

Section 2 — Operations & Supply Chain Alerts

→ Inventory Stockout Warning
→ Reorder Lead Time Conflict Alert
→ Supplier Stress Signal
→ Production Bottleneck Early Warning
→ Quality Incident Pattern Alert
→ WIP Accumulation Alert
→ Delivery Commitment Risk Alert

Section 3 — Financial Health Alerts

→ Receivables Aging Alert
→ Margin Compression Warning
→ Cash Flow Pressure Signal
→ Vendor Payment Cycle Anomaly
→ Cost Overrun Pattern Alert
→ Revenue Mix Shift Alert

Section 4 — Market & Competitive Intelligence Alerts

→ Distributor Loyalty Erosion Signal
→ Competitive Encroachment Warning
→ Demand Spike / Trend Signal
→ New Market Opportunity Flag
→ Pricing Pressure Alert
→ Channel Performance Shift Alert

Section 5 — People & Relationship Intelligence Alerts

→ Client Engagement Drop Alert (B2B Services)
→ Project Margin Compression Alert
→ Renewal Risk Early Warning
→ Upsell Readiness Signal
→ Key Person Dependency Alert

→ Team Utilisation Threshold Alert

Section 6 — Setup & Configuration Guide

→ Configuring Your Alert Thresholds
→ Recommended Day-1 Alert Setup
→ Alert Sensitivity: Conservative vs Aggressive
→ Your Alert Activation Checklist

01 Revenue & Customer Intelligence Alerts

Surface revenue threats and growth opportunities — before they appear in your numbers.

Customer Order Decline Alert

HIGH PRIORITY | DELIVERED VIA: Dashboard · Email · WhatsApp

WHAT IT DETECTS
A customer's order value or frequency has dropped significantly compared to their historical average over the past 30, 60, or 90 days.

WHAT TRIGGERS IT
Order value drops more than 15% vs prior period average, OR order frequency drops by 1+ orders vs expected cadence over the configured window.

WHAT IT MEANS
A declining customer is rarely a sudden loss — it's a quiet drift that compounds. By the time revenue drops visibly, the relationship is already strained. This alert catches it 45–90 days earlier.

ACTION PROMPTED
Call the customer personally. Not to chase an order — to check in. Most drifting customers simply feel forgotten. One proactive call has a dramatically higher recovery rate than a reactive one.

Last-Contact Gap Alert

MEDIUM PRIORITY | DELIVERED VIA: Dashboard · Email · WhatsApp

WHAT IT DETECTS
No logged contact (call, email, meeting, WhatsApp) has been recorded with a customer for longer than your configured threshold — typically 30, 45, or 60 days.

WHAT TRIGGERS IT
Last contact date exceeds the configured gap threshold AND the customer has active orders or revenue history in the past 6 months. Cross-referenced with order value to prioritise high-value dormant relationships.

WHAT IT MEANS
Silence is a signal. Customers who stop hearing from you start exploring alternatives — often without telling you. By the time they reduce orders, they've already mentally moved on.

ACTION PROMPTED
Assign the account to a specific team member with a follow-up date. The alert includes last order value, contact history, and a relationship health score to guide the conversation.

Customer Churn Risk Score Alert

HIGH PRIORITY | DELIVERED VIA: Dashboard · Email · WhatsApp

WHAT IT DETECTS

A customer's composite churn risk score crosses a configurable threshold — combining order decline, last-contact gap, complaint history, and payment pattern signals.

WHAT TRIGGERS IT

Churn risk score exceeds 70 (on a 0–100 scale). Score is recalculated daily across 5 weighted signals: order trend, contact frequency, complaint volume, payment delays, and engagement with your team.

WHAT IT MEANS

The churn risk score is your early warning system before individual alerts have fired. A customer can score high on churn risk even before orders decline visibly — based on subtle combined signals no single system would catch.

ACTION PROMPTED

Escalate to senior leadership or owner-level relationship. Review the full 90-day history. Consider a personal visit, a priority slot offer, or a proactive problem-solving conversation before any mention of the commercial relationship.

Revenue Concentration Risk Alert

MEDIUM PRIORITY | DELIVERED VIA: Dashboard · Email

WHAT IT DETECTS

A single customer or the top 3 customers collectively represent more than the configured percentage of total revenue — creating dangerous dependency.

WHAT TRIGGERS IT

One customer exceeds 25% of total revenue, OR top 3 customers exceed 50% of total revenue. Recalculated monthly against trailing 3-month revenue mix.

WHAT IT MEANS

Revenue concentration is the single most overlooked business risk in Indian mid-market companies. A business where one customer is 30%+ of revenue is not a growing business — it's a single-customer business with overhead.

ACTION PROMPTED

Use this alert to initiate a deliberate diversification conversation at the leadership level. Identify the next 5 target accounts by sector, geography, or product line that would reduce concentration below the threshold.

Deal Pipeline Velocity Alert

MEDIUM PRIORITY | DELIVERED VIA: Dashboard · Email

WHAT IT DETECTS
A deal in the sales pipeline has been in the same stage for longer than the configured threshold, or overall pipeline velocity has slowed significantly vs the prior period average.

WHAT TRIGGERS IT
A deal has been in the same stage for 2× the average stage duration, OR pipeline velocity (deals progressed per week) drops more than 30% vs the prior 8-week average.

WHAT IT MEANS
Slow pipeline velocity is the earliest indicator of a sales conversion problem — weeks before it shows up in revenue. By the time the month-end miss is visible, the pipeline problem was already 6 weeks old.

ACTION PROMPTED
Review stalled deals in the weekly sales conversation. Identify if the delay is buyer-side (procurement, budget cycle) or seller-side (follow-up gap, proposal quality). Velocity data helps distinguish between the two.

Upsell & Expansion Opportunity Signal

OPPORTUNITY PRIORITY | DELIVERED VIA: Dashboard · Email

WHAT IT DETECTS
An existing customer is growing — in revenue, team size, or order frequency — in a way that suggests unmet need for products or services they haven't been offered yet.

WHAT TRIGGERS IT
Customer order frequency increases 20%+ in a new category, OR their business is growing (detected via public signals, order pattern changes) while their spend with you is flat, OR they buy Product A regularly but have never been offered Product B which your other similar customers buy.

WHAT IT MEANS
Your next ■75 lakh of revenue is already in your existing customer base. It's hiding in the gap between what they buy from you and what they could buy from you. This signal finds it before your competitors do.

ACTION PROMPTED
Prepare a specific, relevant proposal for the identified expansion. Reference their growth or changing needs directly. The best upsell conversation is one that makes the customer feel you understand their business better than they expected.

New Customer Acquisition Signal

OPPORTUNITY PRIORITY | DELIVERED VIA: Dashboard · Email

WHAT IT DETECTS

A prospect who has engaged with your business (visited website, downloaded content, responded to outreach, or been referred) matches the profile of your highest-value existing customers.

WHAT TRIGGERS IT

Lead score crosses 65 based on: industry match, revenue range match, engagement recency, referral source quality, and geographic proximity to existing customers.

WHAT IT MEANS

Not all prospects are equal. This signal ensures your sales attention goes to the prospects most likely to become long-term, high-value customers — not just the ones who happen to respond first.

ACTION PROMPTED

Prioritise personal outreach from Nevil or a senior team member within 48 hours of signal. Include a relevant case study from their specific industry in the first message.

02 Operations & Supply Chain Alerts

Prevent production failures, supplier surprises, and delivery crises — before they reach your customers.

Inventory Stockout Warning

HIGH PRIORITY | DELIVERED VIA: Dashboard · Email · WhatsApp

WHAT IT DETECTS
A product or raw material is on track to run out before the next confirmed reorder arrives — based on current consumption rate and supplier lead time.

WHAT TRIGGERS IT
Days of remaining stock divided by daily consumption rate falls below the supplier lead time plus a configured buffer (default: lead time + 3 days). Cross-referenced with open customer orders to identify which commitments are at risk.

WHAT IT MEANS
A stockout that reaches a customer is a relationship problem, not just an operations problem. The Stockout Warning fires days or weeks before the crisis — while you still have time to expedite, substitute, or communicate proactively.

ACTION PROMPTED
Raise a priority reorder immediately. If lead time cannot be shortened, identify substitute products or partial delivery options. Proactively communicate to affected customers before they experience the shortage.

Reorder Lead Time Conflict Alert

HIGH PRIORITY | DELIVERED VIA: Dashboard · Email · WhatsApp

WHAT IT DETECTS
A customer delivery commitment is scheduled during a period where the required raw material or product will not have arrived from the supplier in time — based on current stock levels and confirmed lead times.

WHAT TRIGGERS IT
Delivery commitment date minus current stock days minus supplier lead time results in a negative or zero buffer. Triggered when the buffer falls below 5 days and a confirmed customer order exists for that period.

WHAT IT MEANS
This is the intersection of supply and demand — and it's where most production crises are born. Most manufacturers discover this conflict when the delivery fails. CEO Intel surfaces it up to 3 weeks earlier.

ACTION PROMPTED
Immediately escalate to the production and supply chain team. Options: expedite reorder, advance the production schedule, negotiate a partial delivery, or proactively renegotiate the customer timeline.

Supplier Stress Signal

HIGH PRIORITY | DELIVERED VIA: Dashboard · Email · WhatsApp

WHAT IT DETECTS

A key supplier is showing multiple early stress indicators simultaneously — payment delay pattern, partial delivery history, quality incidents — suggesting supply risk before they communicate it.

WHAT TRIGGERS IT

2 or more of the following within a 60-day window: payment to you delayed 15+ days vs normal cycle, 2+ partial deliveries, 1+ quality rejection, response time to communications increasing. Single signals are monitored; composite signals trigger the alert.

WHAT IT MEANS

Suppliers rarely warn you before they fail. But the data always does. Payment stress, delivery partial-isation, and quality slippage are the three signals that reliably precede a supply failure by 4–8 weeks.

ACTION PROMPTED

Contact the supplier at a senior level — not to escalate, but to understand their situation. Simultaneously begin identifying backup options or alternative sources. Do not wait for a formal failure.

Production Bottleneck Early Warning

MEDIUM PRIORITY | DELIVERED VIA: Dashboard · Email

WHAT IT DETECTS

A production line, machine, or process step is showing patterns — micro-stoppages, output variance, maintenance overdue — that predict a full stoppage before it occurs.

WHAT TRIGGERS IT

Micro-stoppages in a rolling 6-hour window exceed the configured threshold (default: 3 stoppages), OR output variance from target exceeds 15% for 2+ consecutive shifts, OR scheduled maintenance is overdue by more than 5 days.

WHAT IT MEANS

Production bottlenecks are expensive not just in downtime, but in the delivery consequences that follow. An early warning that fires Sunday evening prevents a Wednesday crisis — and protects the customer relationship.

ACTION PROMPTED

Schedule preventive maintenance before the next production run. If maintenance cannot be completed in time, reassign production to an alternate line or adjust the schedule to protect the most critical customer delivery.

Quality Incident Pattern Alert

MEDIUM PRIORITY | DELIVERED VIA: Dashboard · Email

WHAT IT DETECTS

Quality rejections or complaints related to a specific product, material batch, or production line have exceeded a frequency threshold — suggesting a systemic issue rather than isolated incidents.

WHAT TRIGGERS IT

3+ quality incidents related to the same product or production source within a 30-day window, OR quality rejection rate for a product exceeds 2× its historical average in the past 14 days.

WHAT IT MEANS

A single quality incident is a problem. Three incidents from the same source is a pattern — and patterns compound. Left undetected, they lead to customer complaints, returns, and relationship damage that takes months to repair.

ACTION PROMPTED

Initiate a root cause investigation immediately. Quarantine affected batches if applicable. Proactively communicate to any customers who received potentially affected products before they report the issue.

Delivery Commitment Risk Alert

HIGH PRIORITY | DELIVERED VIA: Dashboard · Email · WhatsApp

WHAT IT DETECTS

A confirmed customer delivery is at risk of being missed based on current production status, stock levels, or logistics confirmation — with enough lead time to still intervene.

WHAT TRIGGERS IT

Delivery date is within 7 days AND one or more of: production not yet started, required stock not yet available, logistics not yet confirmed, or a previous delivery to this customer was delayed.

WHAT IT MEANS

A missed delivery is not just an operations failure — it is a customer relationship event. This alert fires while there is still time to either fix the problem or communicate proactively, preserving trust.

ACTION PROMPTED

Contact the customer proactively with a status update and revised commitment before they follow up. A proactive call from a senior person dramatically reduces the relationship impact of a delivery delay.

WIP Accumulation Alert

MEDIUM PRIORITY | DELIVERED VIA: Dashboard · Email

WHAT IT DETECTS

Work-in-progress inventory is accumulating beyond normal thresholds — indicating a bottleneck downstream in the production process that is not yet visible in output metrics.

WHAT TRIGGERS IT

WIP inventory in a specific stage exceeds 150% of the rolling 30-day average for more than 2 consecutive days. Cross-referenced with output metrics to confirm the downstream bottleneck.

WHAT IT MEANS

WIP accumulation is the operational equivalent of a traffic jam — by the time you see it, the problem is already upstream. Early detection allows you to identify and fix the downstream constraint before it compounds.

ACTION PROMPTED

Identify the specific stage where WIP is accumulating. Investigate whether the bottleneck is capacity, quality rework, or material dependency. Prioritise clearing the constraint over feeding more input into the system.

03 Financial Health Alerts

Track the financial signals that matter — before they become cash flow crises or margin surprises.

Receivables Aging Alert

HIGH PRIORITY | DELIVERED VIA: Dashboard · Email · WhatsApp

WHAT IT DETECTS
A customer's outstanding invoice has aged beyond the configured threshold — with a composite signal based on amount, age, and relationship health to prioritise the most critical collections.

WHAT TRIGGERS IT
Invoice outstanding for more than 45 days (configurable), OR total receivables from one customer exceed 20% of monthly revenue, OR payment has been promised but not received within 7 days of the commitment date.

WHAT IT MEANS
Receivables aging is the single most common cause of cash flow pressure in Indian mid-market companies. Money that exists on paper but not in your account is not working capital — it is someone else's interest-free loan.

ACTION PROMPTED
Escalate to a senior leader for personal follow-up. Cross-reference with the relationship health score — a long-term customer with strong history warrants a different tone than a newer account with no payment track record.

Margin Compression Warning

HIGH PRIORITY | DELIVERED VIA: Dashboard · Email

WHAT IT DETECTS
Revenue is growing or stable, but gross margin on a product line, customer segment, or channel is declining — indicating a cost or pricing problem that is not yet visible in top-line numbers.

WHAT TRIGGERS IT
Gross margin on a product, customer, or channel drops more than 3 percentage points in a rolling 60-day window, AND revenue is flat or growing (ruling out volume decline as the cause).

WHAT IT MEANS
Margin compression is the most dangerous financial signal because it hides behind healthy-looking revenue. A business growing its top line while compressing its margin is building a more expensive version of a less profitable business.

ACTION PROMPTED
Investigate the specific driver: is it raw material cost, pricing pressure, discounting behaviour, product mix, or channel cost? Each requires a different response. Do not adjust pricing before understanding the root cause.

Cash Flow Pressure Signal

HIGH PRIORITY | DELIVERED VIA: Dashboard · Email · WhatsApp

WHAT IT DETECTS

The combination of outstanding receivables, upcoming payables, and current bank balance indicates a cash flow gap within the next 30–45 days — before it becomes a cash crisis.

WHAT TRIGGERS IT

Projected cash balance in 30 days (current balance + expected collections – confirmed payables) falls below the configured minimum operating buffer (typically 2× monthly payroll).

WHAT IT MEANS

Cash flow problems are almost never sudden — they are predictable 4–6 weeks in advance if the right signals are connected. Most businesses discover the problem when the account is already under pressure.

ACTION PROMPTED

Initiate accelerated collections on the largest outstanding receivables immediately. Review upcoming payables for any that can be deferred without relationship damage. Identify credit facilities that could be activated if needed.

Vendor Payment Cycle Anomaly

MEDIUM PRIORITY | DELIVERED VIA: Dashboard · Email

WHAT IT DETECTS

The pattern of payments to vendors is changing — either becoming faster (potentially affecting your own cash flow) or slower (potentially damaging supplier relationships) — without a corresponding business decision.

WHAT TRIGGERS IT

Average payment cycle to vendors changes by more than 10 days in either direction vs the prior 90-day average, without a corresponding approved decision to change payment terms.

WHAT IT MEANS

Vendor payment cycles often drift without anyone noticing — finance pays invoices based on availability rather than strategic terms. A drift toward faster payment reduces your working capital. A drift toward slower payment damages supplier trust.

ACTION PROMPTED

Review the drift with your finance team to understand if it reflects a deliberate decision or a process gap. Establish and enforce payment term standards for different supplier categories.

Cost Overrun Pattern Alert

MEDIUM PRIORITY | DELIVERED VIA: Dashboard · Email

WHAT IT DETECTS
A specific cost category — raw materials, logistics, utilities, contract labour — is trending above budget or above historical norms for 2+ consecutive months.

WHAT TRIGGERS IT
Cost in a category exceeds budget by more than 8% for 2 consecutive months, OR exceeds the prior year same-period by more than 15% without a corresponding revenue or volume increase to explain it.

WHAT IT MEANS
Cost overruns that are caught in month 1 are an anomaly. Cost overruns that persist through month 3 are a structural problem. The pattern alert catches the trend before it becomes embedded.

ACTION PROMPTED
Investigate whether the overrun is driven by volume (good), pricing (needs negotiation), process inefficiency (needs fixing), or theft/leakage (needs audit). Each has a fundamentally different response.

Revenue Mix Shift Alert

MEDIUM PRIORITY | DELIVERED VIA: Dashboard · Email

WHAT IT DETECTS
The composition of revenue is changing significantly — a product line, customer segment, or channel is becoming a larger or smaller proportion of total revenue than in prior periods.

WHAT TRIGGERS IT
Any single revenue category changes its share of total revenue by more than 8 percentage points in a 90-day rolling comparison vs the prior 90-day period.

WHAT IT MEANS
Revenue mix shifts matter because different products, customers, and channels have different margins, working capital requirements, and strategic value. A mix that shifts toward lower-margin business can look healthy on the top line while quietly degrading the business.

ACTION PROMPTED
Analyse whether the mix shift is deliberate (a strategy working as intended) or accidental (a market change or team behaviour that needs addressing). Strategy reviews should always start with the current revenue mix.

04 Market & Competitive Intelligence Alerts

Stay ahead of market shifts, competitive moves, and distribution changes before they cost you share.

Distributor Loyalty Erosion Signal

HIGH PRIORITY | DELIVERED VIA: Dashboard · Email · WhatsApp

WHAT IT DETECTS

A distributor is showing multiple signals of reduced commitment — declining billing velocity, reduced scheme participation, increasing credit utilisation, slower claims processing — suggesting a shift in their priority toward a competitor.

WHAT TRIGGERS IT

2 or more of the following in a 60-day window: primary billing velocity declines more than 20% vs prior period, scheme participation drops below 60%, credit utilisation increases beyond normal pattern, claims processing time increases significantly.

WHAT IT MEANS

Distributor loyalty erosion typically precedes a formal channel conflict by 3–4 months. The signals are always there — but they live in different systems. Connected, they tell a story that no individual department can see alone.

ACTION PROMPTED

Engage the distributor principal at a senior level for a relationship review. Understand if the shift is driven by a competitor's trade margins, a service failure on your part, or a change in their business priorities. Act while the relationship can still be saved.

Competitive Encroachment Warning

MEDIUM PRIORITY | DELIVERED VIA: Dashboard · Email

WHAT IT DETECTS

Secondary sales data, field reports, or order patterns suggest a competitor is gaining traction in a geography, channel, or product category that has historically been your stronghold.

WHAT TRIGGERS IT

Secondary offtake in a geography declines more than 12% while primary billing is stable (suggesting distributor is filling the channel but consumer sales are shifting), OR field reports from 3+ sources mention a specific competitor brand in the same timeframe.

WHAT IT MEANS

Market share erosion never happens in boardrooms. It happens at kirana stores, on ecommerce pages, and in distributor conversations. By the time it shows up in formal data, the competitor has already built momentum.

ACTION PROMPTED

Deploy field investigation in the flagged geographies immediately. Understand whether the encroachment is driven by pricing, trade margins, product attributes, or distribution coverage. Respond with targeted, geography-specific action.

Demand Spike / Trend Signal

OPPORTUNITY PRIORITY | DELIVERED VIA: Dashboard · Email · WhatsApp

WHAT IT DETECTS
Unusual reorder velocity, search data, social signals, or category trends suggest a demand surge is building for a product or category — giving you a window to pre-position before the spike hits mainstream.

WHAT TRIGGERS IT
Reorder velocity in a specific product or geography increases more than 25% in a 7-day window, OR 2+ external demand signals (search trends, social mentions, influencer activity) align with the product category in the same period.

WHAT IT MEANS
The difference between riding a trend and chasing it is 11–14 days of early intelligence. Brands that see the demand signal early can pre-position stock, accelerate production, and own the shelf before competitors react.

ACTION PROMPTED
Immediately review production capacity and raw material availability for the affected product. Pre-position stock in the geographies showing the earliest velocity signals. Prepare a rapid response plan for if the mainstream spike arrives.

New Market Opportunity Flag

OPPORTUNITY PRIORITY | DELIVERED VIA: Dashboard · Email

WHAT IT DETECTS
A combination of market signals suggests a geography, customer segment, or product category represents an under-served opportunity that matches your current capabilities.

WHAT TRIGGERS IT
A geography shows high search demand but low distributor penetration for your category, OR a customer segment that matches your existing customer profiles is growing rapidly but represents less than 5% of your current revenue.

WHAT IT MEANS
Most Indian mid-market growth opportunities are identified late — when competitors have already moved. This signal identifies them while the market is still forming, giving you a first-mover window.

ACTION PROMPTED
Commission a focused 30-day investigation of the flagged opportunity before committing resources. The signal tells you where to look — your team's on-the-ground assessment tells you whether to move.

Pricing Pressure Alert

MEDIUM PRIORITY | DELIVERED VIA: Dashboard · Email

WHAT IT DETECTS

Win/loss data, deal velocity, or customer feedback signals suggest your pricing is coming under competitive pressure in a specific segment, geography, or product category.

WHAT TRIGGERS IT

Deal win rate in a specific category drops below 40% over a 60-day window, OR 3+ deals in the same period are lost with "pricing" cited as the primary reason, OR average discount given to close deals increases more than 5 percentage points vs prior period.

WHAT IT MEANS

Pricing pressure is one of the earliest signals of competitive intensity. Catching it early gives you strategic options — product differentiation, cost reduction, or value communication — that disappear once the pressure becomes market-wide.

ACTION PROMPTED

Do not respond to pricing pressure by lowering prices before understanding whether the issue is truly price or perceived value. A pricing pressure alert should trigger a value communication review before a commercial decision.

Channel Performance Shift Alert

MEDIUM PRIORITY | DELIVERED VIA: Dashboard · Email

WHAT IT DETECTS

A sales channel — direct, distributor, ecommerce, or retail — is changing its contribution to revenue significantly, indicating either an opportunity to accelerate or a risk to address.

WHAT TRIGGERS IT

A channel's revenue contribution changes by more than 10 percentage points in a 90-day rolling comparison, OR a previously growing channel shows 3 consecutive months of declining contribution.

WHAT IT MEANS

Channel mix shifts are often invisible until they are significant. A distributor channel that is quietly declining while ecommerce grows may require a fundamental strategic reconsideration — or may simply need targeted investment.

ACTION PROMPTED

Investigate whether the shift is driven by market forces (external), your own investment allocation (internal), or competitor activity (external with response options). Each scenario requires a different strategic response.

05 People & Relationship Intelligence Alerts

For B2B service businesses — track client health, project margin, and renewal risk before they become revenue problems.

Client Engagement Drop Alert

HIGH PRIORITY | DELIVERED VIA: Dashboard · Email · WhatsApp

WHAT IT DETECTS
A client's engagement level — response time, meeting participation, feedback quality, and communication frequency — has declined significantly, suggesting deteriorating relationship health before it shows in project metrics.

WHAT TRIGGERS IT
Average client response time increases by more than 48 hours vs their historical baseline, OR a client misses 2+ scheduled meetings without rescheduling, OR the volume of proactive communication from the client drops more than 50% in a 30-day window.

WHAT IT MEANS
In B2B services, clients disengage before they leave. The relationship health signals fire weeks before a formal conversation about scope reduction or termination. Catching the engagement drop early is the difference between saving the relationship and managing a graceful exit.

ACTION PROMPTED
Escalate to a senior relationship owner for a proactive check-in. The conversation should focus on value received and forward-looking outcomes — not on the engagement gap itself. Make the client feel seen, not monitored.

Project Margin Compression Alert

HIGH PRIORITY | DELIVERED VIA: Dashboard · Email

WHAT IT DETECTS
The actual margin on a project is declining vs the original proposal margin — due to scope creep, resource overrun, or rework — before the project has been formally flagged by the project team.

WHAT TRIGGERS IT
Actual hours or costs consumed on a project exceed the budget by more than 15%, OR scope changes have been delivered without a corresponding change order, OR resource utilisation on a project exceeds planned allocation by more than 20%.

WHAT IT MEANS
Project margin compression is the hidden profit leak in most B2B service businesses. Every unbilled hour of scope creep and every overrun resource is margin that existed at proposal stage and disappeared without a decision being made.

ACTION PROMPTED
Initiate a project review immediately to assess the current margin position and identify the driver. Determine whether a change order conversation is appropriate. Establish clear scope boundaries for remaining delivery.

Renewal Risk Early Warning

HIGH PRIORITY | DELIVERED VIA: Dashboard · Email · WhatsApp

WHAT IT DETECTS

A client contract approaching its renewal date is showing risk signals — engagement decline, scope reduction, budget signals, or team changes on the client side — suggesting renewal is not certain.

WHAT TRIGGERS IT

A contract renewal is within 90 days AND one or more of: client engagement score below 60, key sponsor has changed or departed, scope has been reduced in the past 60 days, payment has been delayed more than once.

WHAT IT MEANS

Renewal risk discovered at 90 days gives you a full quarter to save the relationship. Renewal risk discovered at 30 days gives you a crisis conversation. The same intelligence, 60 days earlier, changes the entire dynamic.

ACTION PROMPTED

Assign senior ownership to the renewal conversation immediately. Build a specific value case showing measurable outcomes delivered in the current contract period. Identify the new sponsor if the original one has changed.

Upsell Readiness Signal

OPPORTUNITY PRIORITY | DELIVERED VIA: Dashboard · Email

WHAT IT DETECTS

An existing client is showing signals of readiness for an expanded engagement — their business is growing, their team is expanding, they are asking questions outside the current scope, or a new business challenge has emerged that you can solve.

WHAT TRIGGERS IT

Client business revenue grows more than 20% (from public signals or direct data), OR their team expands significantly, OR they have not expanded scope with you in 10+ months despite growing complexity, OR they mention a challenge in regular communication that falls within your capabilities.

WHAT IT MEANS

The most profitable new business is existing client expansion. An upsell conversation with a client who trusts you has a dramatically higher conversion rate than a new business pitch — and costs a fraction of the sales investment.

ACTION PROMPTED

Prepare a specific, relevant proposal for the identified expansion before the next client meeting. Reference their growth or changing needs directly. The proposal should make them feel you understand their business better than they expected.

Key Person Dependency Alert

MEDIUM PRIORITY | DELIVERED VIA: Dashboard · Email

WHAT IT DETECTS
A significant portion of your client relationship or delivery is concentrated in a single team member — creating a fragility risk if that person changes roles, leaves, or becomes unavailable.

WHAT TRIGGERS IT
A single team member is the primary contact for clients representing more than 35% of your revenue, OR a single team member leads delivery on more than 40% of active projects.

WHAT IT MEANS
Key person dependency is a business risk that most service firms only discover when the person leaves. The departure of one well-connected team member can trigger multiple client reviews simultaneously.

ACTION PROMPTED
Proactively build relationship redundancy on high-dependency accounts. Ensure at least 2 team members have direct relationships with every client in the top 50% of revenue. Document institutional knowledge systematically.

Team Utilisation Threshold Alert

MEDIUM PRIORITY | DELIVERED VIA: Dashboard · Email

WHAT IT DETECTS
Team utilisation — the percentage of billable hours vs total available hours — is moving outside the optimal range, either creating delivery risk (over-utilised) or profitability risk (under-utilised).

WHAT TRIGGERS IT
Team or individual utilisation exceeds 85% for more than 2 consecutive weeks (over-utilisation risk), OR drops below 65% for more than 3 consecutive weeks (under-utilisation and revenue risk).

WHAT IT MEANS
Utilisation outside the 70–80% optimal range is costly in both directions. Over-utilisation leads to quality issues, team burnout, and client experience problems. Under-utilisation is invisible revenue that should have been earned.

ACTION PROMPTED
For over-utilisation: review upcoming pipeline and consider hiring decisions. For under-utilisation: accelerate new business conversations and consider whether existing clients have un-scoped work that can be activated.

06

Setup & Configuration Guide

How to configure your alerts, set your thresholds, and activate the right intelligence from Day 1.

CONFIGURING YOUR THRESHOLDS

Setting Alert Sensitivity

Every alert in CEO Intel has configurable thresholds — the specific numbers that determine when an alert fires. Getting these right is the difference between an intelligence system that works for you and one that creates noise.

SETTING	CONSERVATIVE	BALANCED (RECOMMENDED)	AGGRESSIVE
Customer order decline	25% drop	15% drop	10% drop
Last-contact gap	60 days	45 days	30 days
Churn risk score	80+	70+	60+
Receivables aging	60 days	45 days	30 days
Inventory buffer	Lead time + 1 day	Lead time + 3 days	Lead time + 5 days
Supplier stress signals	3 signals	2 signals	1 signal
Revenue concentration	35%	25%	20%

Nevil's recommendation: start with Balanced settings for the first 30 days. Review which alerts fired and whether each was actionable. Adjust thresholds based on your specific business rhythms and data patterns. Most clients settle into a custom configuration within 60–90 days.

YOUR DAY-1 ALERT ACTIVATION CHECKLIST

Recommended Alerts to Switch On From Day 1

Not every alert needs to be active from the first day. Start with the highest-impact alerts across revenue, operations, and finance — then add the more nuanced signals once your baseline is established.

REVENUE & CUSTOMER — Start Here

- ■ Customer Order Decline Alert — the single most important alert for any business
- ■ Last-Contact Gap Alert — set to 45 days for the first 30 days
